# КАФЕДРА ТЕЛЕМАТИКА

## Семинар по специальности на английском языке (Workshop in English)

### тема

## A Search for the Missing Science of Consciousness

### занятие 8

---

23 марта  
2022 г.

# Что было на прошлой лекции

Вычисления - это процесс, который реализует отображение между некоторыми символическими структурами (доменами). Реализованное отображение может иметь форму

**function,**

**operator,**

**algorithms**

or .... specific

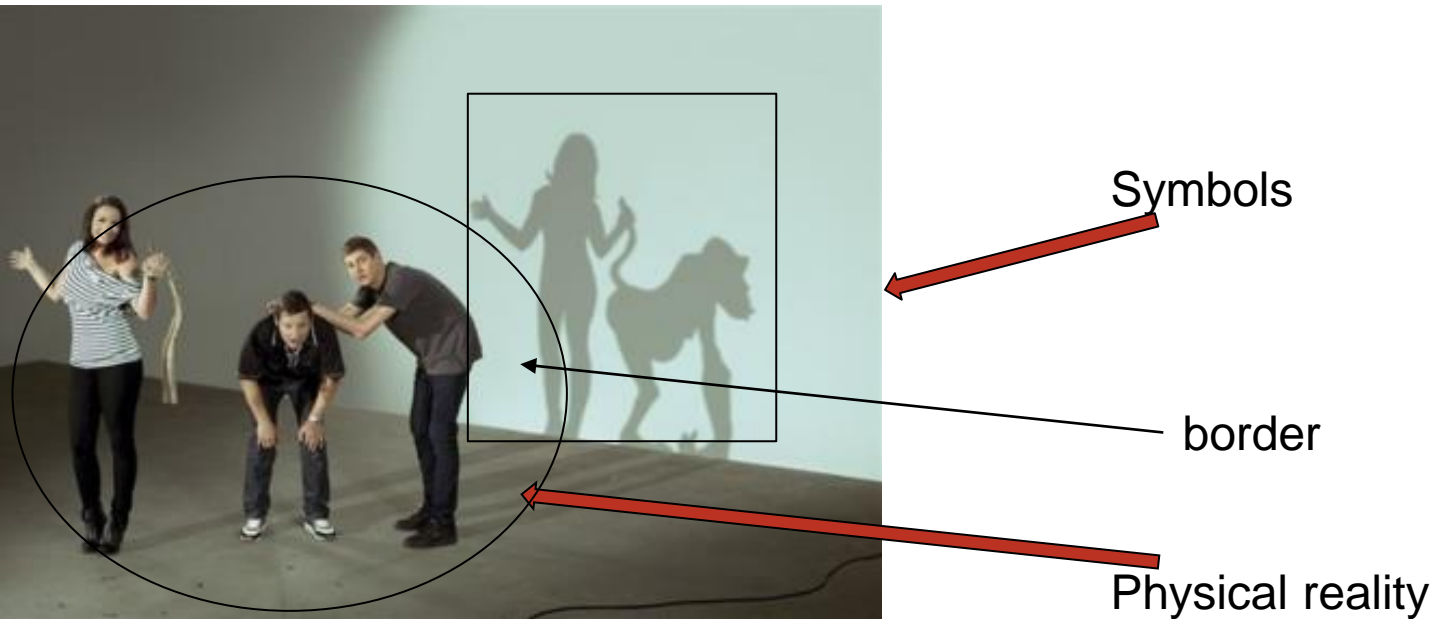

**relationship.**

Any symbolic structure may be

- **numbers**:  $3 + 2$  equals 5,  
**or may not.**

All depends from от наличия механизмов, которые  
аналогичны процессам

вычислений

В науке давно известна физическая невычислимость «прошлых» состояний термодинамических процессов, и полная обратимость во времени и изотропность в пространстве фундаментальных законов.....

It has long been known in science physical **incalculability** of "past" states of thermodynamic processes, and complete **reversibility** in time and **isotropy** in space **of fundamental laws**

но до сих пор нет ясности как эти ограничения преодолеваются при функционировании мозга

**quod sentimus loquamur**

МЫ ЧУВСТВУЕМ, ЧТО ГОВОРИМ

**quod loquimur sentiamus**

МЫ ПРЕДСТАВЛЯЕМ ЭТОТ ОПЫТ

математика и компьютерные науки тесно связаны с передним краем физических исследований  
Р. Пенроуз

. ВЫЧИСЛЕНИЯ – это работа с числами  
СОЗНАНИЕ – это обработка информации

**Is there and what is the fundamental difference between the "processing" of numbers or calculations and the processing of information or consciousness?**

Nowadays there are 2 major approaches to AI:

- **statistical machine learning** (learning from the data, e.g. learning to differentiate cats from dogs by looking at the pixels of many labeled photos)
- **symbolic AI** / logical reasoning / computer algebra (e.g. manipulate  $2y=x$  into  $y=0.5x$  or deduce from “all men are mortal” and “John is a man” that “John is mortal.”)

Humans mind use some form of both of the above. Only using one of the above would be insufficient to explain the intelligence **humans have demonstrated**.

1. Statistical machine learning is nowadays often implemented via **neural networks** which are “formal” inspired by the human brain.
2. As for symbolic AI, is apparently similar to algebraic manipulations with “numbers” or make logical deductions ..... **pretty quickly**.

Fundamental question is, how exactly do we combine #1 and #2 ?  
There are many possible approaches.

The are no hard problems to provide real calculation , but only problems that are hard to certain level of understanding how to use the obtain results ....

## theses.

- Intelligent computation vs pure digital computation - manipulation of physical entities whose properties are related to energy and matter like as abstract symbols.
- "Inputs" of intelligent computing come in the form of representations of physical entities (action), and the output can be either been as abstract symbol or physical action or even both of two.
- Computational theory of mind should has a specific language describing the process of reducing the entropy of environments by process of explanation.

# What is the nature of “mental number” that involved in intelligent calculations

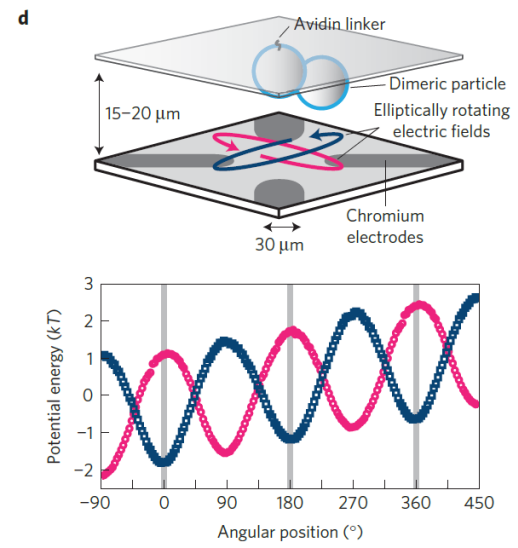

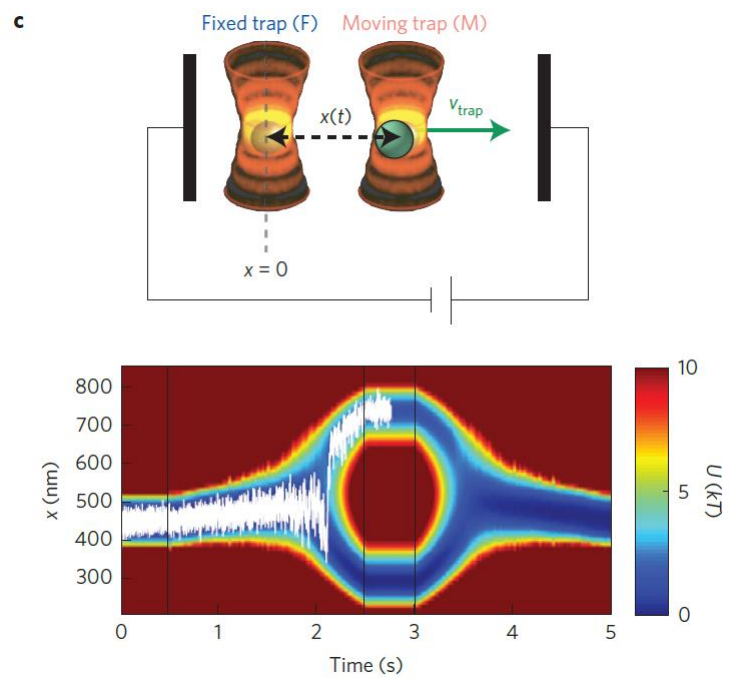

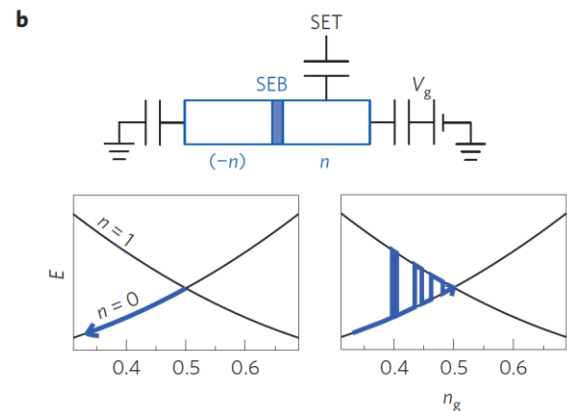

- Humans develop a mental model of the world based on what they are able to perceive with their limited senses or ...by unlimited resource of exaitellectual calculate ability
- Understanding the mechanism of brain calculation ability is perhaps the most fundamental challenge for modern scientists.

## Mental model of reality:

- The image of the world around us is just a model of our mind.
- Nobody in his head imagines all the world, only selected concepts, and relationships between symbol form of knowledge and natural system

What is Physical representation of numbers ???

Experimental realizations: Szilárd engine - partition is inserted into a box containing a single molecule and surrounded by a thermal reservoir - СОЗДАНИЮ ТЕХНОЛОГИИ ОХЛАЖДЕНИЯ БЕЗ ДВИЖУЩИХСЯ ЧАСТЕЙ МЕХАНИЗМА

Если у вас есть 1 бит, с которым можно “поиграть”, то его энтропия пропорциональна логарифму двух, поскольку бит имеет два возможных состояния

physical meaning of the non-equilibrium free energy:  
How to drive the system from the non-equilibrium state to the equilibrium state...

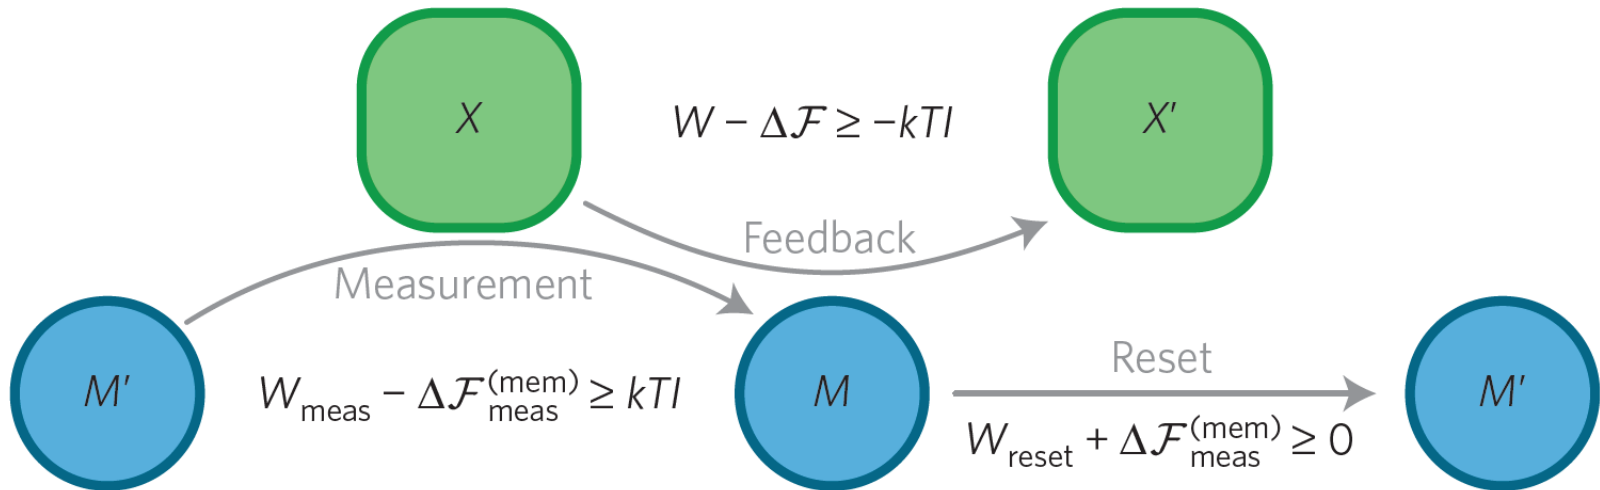

· Shannon entropy coincides with the equilibrium entropy for canonical equilibrium states

Toy model of a memory- memory can either be symmetric or asymmetric

A measurement is a thermodynamic process in which we vary the memory from  $M^0 \rightarrow M$  to develop information  $I$  about the system  $X$ .

11

**new theoretical framework:** information reservoirs, are treated on an equal footing to other thermodynamic reservoirs, such as thermal or chemical baths

- Fundamental questions about information and thermodynamics are under debate, such as the coincidence between the thermodynamic and psychological arrows of time
- Understanding the subjectivity of entropy sheds light on the foundations of the general physical theory of information
- Interesting thermodynamic phenomena, such as the emergence of entropic forces that are related to the accuracy of computers feature – one of priority challenge of science
